Graphs

A graph G = (V, E) is

- V = set of vertices
- ightharpoonup E = set of edges = subset of $V \times V$

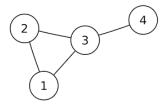

Undirected graphs

In an undirected graph:

- ► Edge (u, v) = edge (v, u)
- No self-loops

In the graph below, (2,1) = (1,2)

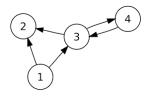

There is no edge (self-loop) such as (i, i)

Directed graphs

In a directed graph:

▶ Edge (u,v) goes from vertex u to vertex v, notated $u \to v$ In the graph below, there is an edge $(1 \to 2)$ but no edge $(2 \to 1)$, thus edge $(u,v) \neq$ edge (v,u)

Connected graphs

A connected graph has a path from every node to every other

I believe the graph in Figure 1 is connected

The graph in Figure 2 is definitely not connected, there is no path from node 0 to node 1.

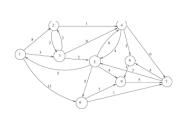

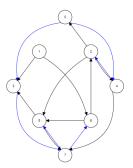

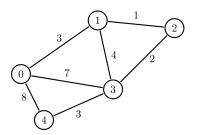

Figure – 1

Weighted graphs

A weighted graph associates weights with the edges

Multigraphs

A multigraph allows multiple edges between a same pair of nodes

The graph below is a weighted multigraph. For example there are 2 edges $(A \rightarrow B)$.

Some confuse edges $(B \to C)$ and $(C \to B)$ for defining a multigraph, it is not!

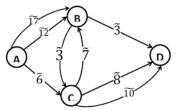

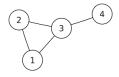

Figure 6: A directed multigraph G with i-v fuzzy weighted area.

Degrees of nodes

The degree of a node v in an undirected graph is the number of adjacent edges

In the undirected graph below, the degree of node 3 is 3 while the degree of node 4 is $1\,$

Directed graphs have in-degree and out-degree

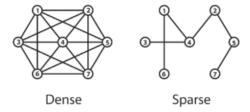

In the directed graph below, the in-degree of node 2 is 2 while its out-degree is 0. The out-degree of node 1 is 2

Graphs

We will typically express the running time of algorithms on graphs in terms of |E| and |V| (often dropping the |'s)

- ▶ If $|E| \approx |V|^2$ the graph is **dense**
- ▶ If $|E| \approx |V|$ the graph is **sparse**

Representing Graphs: adjacency matrix

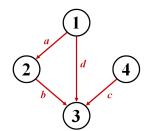

When working with dense or sparse graphs, you may want to use different data structures to represent these graphs

Assume
$$V = \{1, 2, ..., n\}$$

An adjacency matrix representation of a graph is a $n \times n$ matrix A:

- ▶ A[i,j] = 1 (or weight of edge) if edge $(i,j) \in E$
- ► A[i,j] = 0 if edge $(i,j) \notin E$

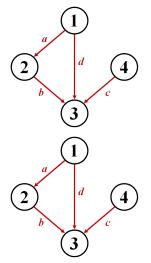

Example:

Α	1	2	3	4
1				
2				
3			??	
4				

Graphs : Adjacency Matrix

Example:

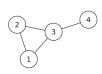

Α	1	2	3	4
1				
2				
3			??	•
4				

Α	1	2	3	4
1		а	d	
2			b	
3				
4			С	

Graphs: Adjacency Matrix

- ▶ Using an adjacency matrix, an $n \times n$ array is needed to store it, so it has a $O(V^2)$ space requirement
- ► The maximum amount of storage needed by an adjacency matrix representation of an undirected graph with 4 vertices is 6 bits in unweighted graphs, 6 integers for weighted graphs. This is because
 - Undirected graph implies that the matrix is symmetric
 - No self-loops, therefore don't need diagonal

	1	2	3	4
1		1	1	
2			1	
3				1
4				

Graphs: Adjacency Matrix

The adjacency matrix is a dense representation

- Usually too much storage for large graphs
- But can be very efficient for small graphs

Most large interesting graphs are sparse

► For this reason the adjacency list is often a more appropriate respresentation

Representing graphs: adjacency lists

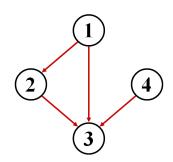

Declare an array of pointers of size n, each entry pointing to a link list

For each vertex $v \in V$, stores the vertices adjacent to v in the link list pointed to by Adj[v] (see example below)

Example:

- ightharpoonup Adj[1] = {2,3}
- ightharpoonup Adj[2] = {3}
- $Adj[3] = \{\}$
- ightharpoonup Adi[4] = {3}

Variation : can also keep a list of edges coming *into* vertex

Graphs: Adjacency List

How much space is required?

- ► For directed graphs, # of items in adjacency lists is $\sum \text{out-degree}(v) = |E| \text{ takes } \Theta(V + E) \text{ storage}$
- For undirected graphs, # items in adjcency lists is $\sum \text{degree}(v) = 2|E|$, also in $\Theta(V + E)$ storage

So : Adjacency lists take O(V + E) space.

For dense graphs, |E| is closed to $|V^2|$, for sparse graphs $|E| \approx V$. So for sparse graphs the space requirement is about O(V) which is much better than adjacency matrices

Graph searching: Breadth-First Search

Explore a graph, turning it into a tree

- One vertex at a time
- Expand frontier of explored vertices across the **breadth** of the frontier

Builds a tree over the graph

- Pick a source vertex to be the root
- Find its children, then their children, etc.

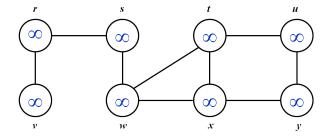

Breadth-First Search: Algorithm

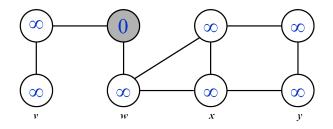

```
BFS(G, s)
  for each u \in G.V - \{s\}
    u.color = WHITE
    u.d = \infty; /* u.d is distance from source s to u */
    u.\pi = NIL /* u.\pi is the predecessor of u */
  s.color = GRAY
  s.d = 0; s.\pi = NIL
  Q = \emptyset
  Enqueue(Q,s)
  while (Q not empty)
    u = Dequeue(Q)
    for each v ∈ u.adj
      if (v.color == WHITE)
         v.color = GREY
         v.d = u.d + 1
         v.\pi = u
         Enqueue(Q, v);
    u.color = BLACK:
```

Breadth-First Search: Algorithm

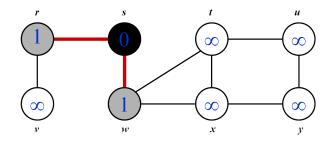

- White vertices have not been discovered
 - All vertices start out white
- Grey vertices are discovered but not fully explored
 - They may be adjacent to white vertices
- Black vertices are discovered and fully explored
 - They are adjacent only to black and gray vertices

Explore vertices by scanning adjacency list of grey vertices

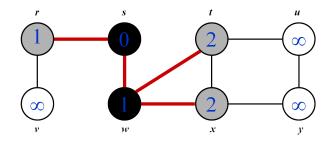

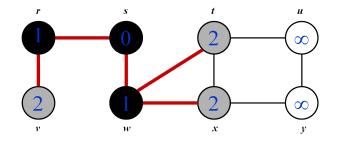

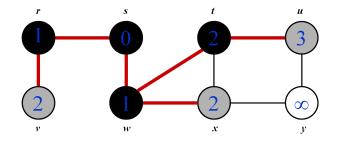

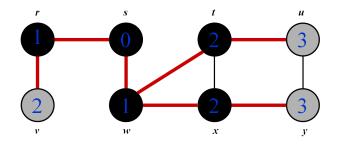

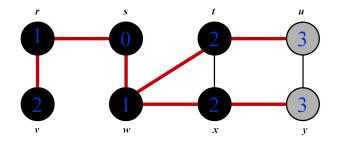

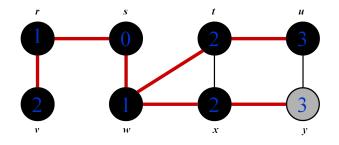

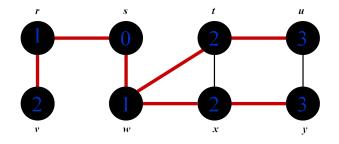

Q: Ø

BFS : time complexity analysis

```
BFS(G, s)
  for each u \in G.V - \{s\}
    u.color = WHITE
    u.d = \infty; u.\pi = NIL
  s.color = GRAY
  s.d = 0; s.\pi = NIL
  Q = \emptyset
  Enqueue(Q,s)
  while (Q not empty)
    u = Dequeue(Q)
    for each v ∈ u.adj
      if (v.color == WHITE)
        v.color = GREY
        v.d = u.d + 1
        v.\pi = u
         Enqueue(Q, v);
    u.color = BLACK;
```

- ▶ Initialisation phase takes O(V)
- ▶ while iterates *V* times
 - In the worst case the inner **for** loop can run V-1 times, thus in O(V)
 - ► So O(V²) for the **while** loop in worst case

BFS: aggregate analysis

Assuming the inner for loop in the while loop is our basic operation, how many time this for can be executed? $\sum_{k \in V} deg(k) = 2|E|$

```
BFS(G, s)
                                        s = \{r,w\}
  for each k \in G.V - \{s\}
                                        r = \{v,s\}
    k.color = WHITF
                                        w = \{s,t,x\}
    k.d = \infty : k.\pi = NIL
                                        v = \{y\}
  s.color = GRAY
                                       t = \{w,x,u\}
  s.d = 0: s.\pi = NIL
                                        x = \{w,y,t\}
  Q = \emptyset
                                        u = \{t,y\}
  Enqueue(Q,s)
                                        v = \{x,u\}
  while (Q not empty)
    k = Dequeue(Q)
                                       Iteration 1, k = s, v = \{r, w\}
    for each v ∈ k.adj
                                       Iteration 2 k = r, v = \{v, s\}
      if (v.color == WHITE)
                                       Iteration 3 k = w, v = \{s, t, x\}
         v.color = GRFY
                                       Iteration 4 k = v, v = \{y\}
         v.d = k.d + 1
                                       Iteration 5 k = t, v = \{w, x, u\}
         v.\pi = k
                                       Iteration 6 k = x, v = \{w, y, t\}
         Enqueue(Q, v);
                                       Iteration 7 k = y, v = \{t, y\}
    u.color = BLACK;
                                       Iteration 8 k = u, v = \{x, u\}
```

BFS : aggregate analysis

In one iteration k of the **while** loop, each iteration of the **for** loop copy in the queue Q one white node from the adjacency list of node k

```
BFS(G, s)
                                        s = \{r,w\}
  for each k \in G.V - \{s\}
                                        r = \{v,s\}
    k.color = WHITE
                                        w = \{s,t,x\}
    k.d = \infty: k.\pi = NIL
                                        v = \{y\}
  s.color = GRAY
                                        t = \{w, x, u\}
  s.d = 0: s.\pi = NIL
                                        x = \{w, v, t\}
  Q = \emptyset
                                        u = \{t.v\}
  Enqueue(Q.s)
                                        v = \{x,u\}
  while (Q not empty)
    k = Dequeue(Q)
                                       Iteration 0 of the while loop Q = \{s\}
    for each v ∈ k.adi
                                       Iteration 1, k = s, Q = \{r, w\}
      if (v.color == WHITE)
                                       Iteration 2 k = r, Q = \{w, v\}
         v.color = GREY
                                       Iteration 3 k = w, Q = \{v, t, x\}
         v.d = k.d + 1
                                       Iteration 4 k = v, Q = \{t, x, y\}
         v.\pi = k
                                       Iteration 5 k = t, Q = \{x, y, u\}
         Enqueue(Q, v):
                                       Iteration 6 k = x, Q = \{y, u\}
    u.color = BLACK:
                                       Iteration 7 k = y, Q = \{u\}
                                       Iteration 7 k = u, Q = \{\}
```

BFS : aggregate analysis

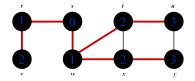

```
BFS(G, s)
  for each u \in G.V - \{s\}
    u.color = WHITE
    u.d = \infty : u.\pi = NIL
  s.color = GRAY
  s.d = 0; s.\pi = NIL
  Q = \emptyset
  Enqueue(Q,s)
  while (Q not empty)
    u = Dequeue(Q)
    for each v ∈ u.adi
      if (v.color == WHITE)
        v.color = GRFY
        v.d = u.d + 1
        v.\pi = u
         Enqueue(Q, v);
    u.color = BLACK;
```

- Actually, each edge is considered at most one time for all the V iterations of the inner for loop, so rather we use aggregate analysis:
 - rather than considering the worst case of the for loop, we consider
 - the total number of iterations of the for loop over the V iterations of the while loop
 - ► This total number cannot exceed E as each edge is considered at most once
- ► Total running time : O(V + E)

Breadth-First Search & shortest path

In an unweighted, undirected grah, BFS calculates the *shortest-path* distance to the source vertex

- Shortest-path distance $\delta(s, v) = \text{minimum number of edges from } s \text{ to } v, \text{ or } \infty \text{ if } v \text{ not reachable from } s$
- ▶ BFS builds *breadth-first tree*, in which paths to root represent shortest paths in *G*
 - Thus can use BFS to calculate shortest path from one vertex to the others in the graph in O(V + E) time

Depth-First Search

Depth-first search is another strategy for traversing a graph

- Explore "deeper" in the graph whenever possible
- Edges are explored out of the most recently discovered vertex v that still has unexplored edges
- ▶ When all of v's edges have been explored, backtrack to the vertex from which v was discovered

Depth-First Search

Vertices initially colored white

Then each vertex is colored gray when discovered

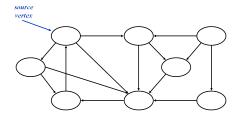

Then each vertex is colored black when its exploration is completed

Depth-First Search: Algorithm

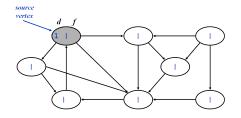

u.d =time node u is first visited; u.f =time when the exploration of the node u is completed

```
\begin{aligned} \mathsf{DFS}(\mathsf{G}) \\ & \textbf{for} \ \mathsf{each} \ \mathsf{vertex} \ \mathsf{u} \in \mathsf{G.V} \\ & \mathsf{u.color} = \mathsf{WHITE}; \\ & \mathsf{time} = \mathsf{0}; \\ & \textbf{for} \ \mathsf{each} \ \mathsf{vertex} \ \mathsf{u} \in \mathsf{G.V} \\ & \mathsf{if} \ (\mathsf{u.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{u}); \end{aligned}
```

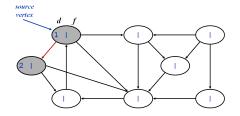

```
\begin{split} \mathsf{DFS\_Visit}(\mathsf{u}) \\ \mathsf{u.color} &= \mathsf{GREY}\,; \\ \mathsf{time} &= \mathsf{time}{+}1\,; \\ \mathsf{u.d} &= \mathsf{time}\,; \\ \mathbf{for} \; \mathsf{each} \; \mathsf{v} \; \in \; \mathsf{u.Adj[]} \\ &\quad \mathsf{if} \; (\mathsf{v.color} == \mathsf{WHITE}) \\ &\quad \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ \mathsf{u.color} &= \mathsf{BLACK}\,; \\ \mathsf{time} &= \mathsf{time}{+}1\,; \\ \mathsf{u.f} &= \mathsf{time}\,; \end{split}
```

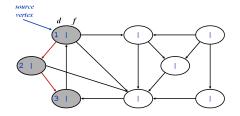

```
\begin{split} DFS\_Visit(u) \\ u.color &= GREY \,; \\ time &= time+1 \,; \\ u.d &= time \,; \\ \textbf{for each } v \in u.Adj[] \\ if (v.color &== WHITE) \\ DFS\_Visit(v) \,; \\ u.color &= BLACK \,; \\ time &= time+1 \,; \\ u.f &= time \,; \end{split}
```

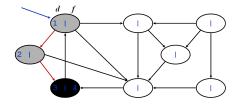

```
\begin{split} \mathsf{DFS\_Visit}(u) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \; \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

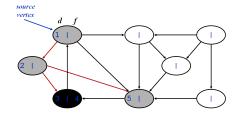

```
\begin{split} \mathsf{DFS\_Visit}(u) \\ & \text{ u.color } = \mathsf{GREY} \,; \\ & \mathsf{time} = \mathsf{time} \! + \! 1 \,; \\ & \mathsf{u.d} = \mathsf{time} \,; \\ & \mathsf{for} \; \mathsf{each} \; \mathsf{v} \; \in \mathsf{u.Adj[]} \\ & \text{ if } \; (\mathsf{v.color} = = \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v}) \,; \\ & \mathsf{u.color} = \mathsf{BLACK} \,; \\ & \mathsf{time} = \mathsf{time} \! + \! 1 \,; \\ & \mathsf{u.f} = \mathsf{time} \,; \end{split}
```

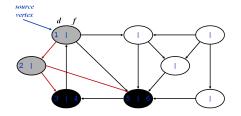

```
\begin{split} \mathsf{DFS\_Visit}(u) \\ & \text{ u.color } = \mathsf{GREY} \,; \\ & \mathsf{time} = \mathsf{time} \! + \! 1 \,; \\ & \mathsf{u.d} = \mathsf{time} \,; \\ & \mathsf{for} \; \mathsf{each} \; \mathsf{v} \; \in \mathsf{u.Adj[]} \\ & \text{ if } \; (\mathsf{v.color} = = \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v}) \,; \\ & \mathsf{u.color} = \mathsf{BLACK} \,; \\ & \mathsf{time} = \mathsf{time} \! + \! 1 \,; \\ & \mathsf{u.f} = \mathsf{time} \,; \end{split}
```

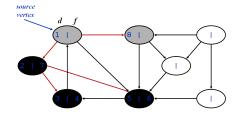

```
\begin{split} \mathsf{DFS\_Visit}(\mathsf{u}) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time} + 1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \; \mathsf{each} \; \mathsf{v} \in \mathsf{u.Adj[]} \\ & \mathsf{if} \; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time} + 1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

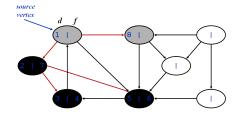

```
\begin{split} \mathsf{DFS\_Visit}(u) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \; \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

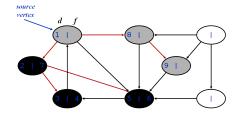

```
\begin{split} \mathsf{DFS\_Visit}(\mathsf{u}) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time} + 1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time} + 1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

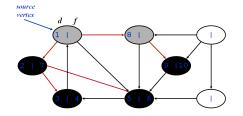

```
\begin{split} \mathsf{DFS\_Visit}(\mathsf{u}) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

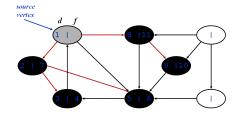

```
\begin{split} \mathsf{DFS\_Visit}(\mathsf{u}) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

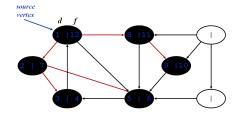

```
\begin{split} \mathsf{DFS\_Visit}(\mathsf{u}) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

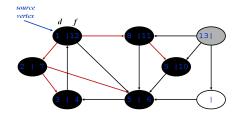

```
\begin{split} \mathsf{DFS\_Visit}(\mathsf{u}) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

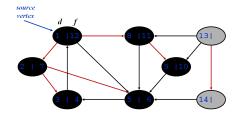

```
\begin{split} \mathsf{DFS\_Visit}(u) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \; \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

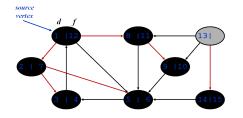

```
\begin{split} \mathsf{DFS\_Visit}(u) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \; \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

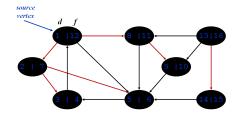

```
\begin{split} \mathsf{DFS\_Visit}(\mathsf{u}) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

```
\begin{split} \mathsf{DFS\_Visit}(u) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \; \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

```
\begin{split} \mathsf{DFS\_Visit}(u) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathsf{for} \;\mathsf{each}\; \mathsf{v} \in \mathsf{u.Adj[]} \\ & \mathsf{if}\; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{split}
```

```
\begin{split} DFS\_Visit(u) \\ u.color &= GREY; \\ time &= time+1; \\ u.d &= time; \\ \textit{for each } v \in u.Adj[] \\ if (v.color &== WHITE) \\ DFS\_Visit(v); \\ u.color &= BLACK; \\ time &= time+1; \\ u.f &= time; \end{split}
```

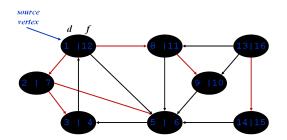

Aggregate analysis of DFS

- ▶ The two **for** loops in DFS(G) each takes $\Theta(V)$
- ► The procedure DFS_visit is called exactly once for each vertex v ∈ V
- ▶ The **for** loop in DFS_visit is executed |u.adj[]| times
- ▶ Since $\sum_{v \in V} |u.adj[]| = \Theta(E)$, the total cost of DFS_visit is $\Theta(E)$
- ▶ The running time of the DFS algorithm is $\Theta(V + E)$

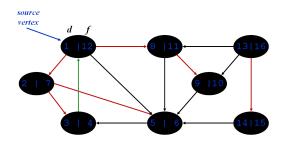

```
\begin{array}{lll} \mathsf{DFS}(\mathsf{G}) & \mathsf{DFS\_Visit}(\mathsf{u}) \\ & \mathbf{for} \ \mathsf{each} \ \mathsf{vertex} \ \mathsf{u} \in \mathsf{G.V} & \mathsf{u.color} = \mathsf{GI} \\ & \mathsf{u.color} = \mathsf{WHITE}; & \mathsf{time} = \mathsf{time} \\ & \mathsf{time} = \mathsf{0}; & \mathsf{u.d} = \mathsf{time}; \\ & \mathsf{for} \ \mathsf{each} \ \mathsf{vertex} \ \mathsf{u} \in \mathsf{G.V} & \mathsf{for} \ \mathsf{each} \ \mathsf{v} \in \mathsf{G.V} \\ & \mathsf{if} \ (\mathsf{u.color} == \mathsf{WHITE}) & \mathsf{if} \ (\mathsf{v.color} \\ & \mathsf{DFS\_Visit}(\mathsf{u}); & \mathsf{DFS\_Vi} \\ & \mathsf{u.color} = \mathsf{BI} \\ \end{array}
```

```
\begin{aligned} & \mathsf{PFS\_Visit}(\mathsf{u}) \\ & \mathsf{u.color} = \mathsf{GREY}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.d} = \mathsf{time}\,; \\ & \mathbf{for} \; \mathsf{each} \; \mathsf{v} \; \in \; \mathsf{u.Adj}[] \\ & \mathsf{if} \; (\mathsf{v.color} == \mathsf{WHITE}) \\ & \mathsf{DFS\_Visit}(\mathsf{v})\,; \\ & \mathsf{u.color} = \mathsf{BLACK}\,; \\ & \mathsf{time} = \mathsf{time}{+}1\,; \\ & \mathsf{u.f} = \mathsf{time}\,; \end{aligned}
```

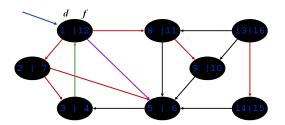

- ► Tree edge : encounter new (white) vertex
 - ▶ The tree edges form a spanning forest

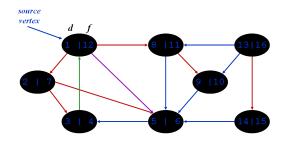

- ► Tree edge : encounter new (white) vertex, edges of the DFS
- ▶ Back edge : from descendant to ancestor in DFS tree
 - Encounter a grey vertex (grey to grey)

- Tree edge : encounter new (white) vertex, edges of the DFS
- Back edge : from descendant to ancestor in DFS tree
- ► Forward edge : non-tree edges from ancestor to descendant in DFS tree

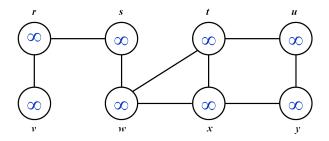

- ► Tree edge : encounter new (white) vertex, edges of the DFS
- ▶ Back edge : from descendant to ancestor in DFS tree
- ► Forward edge : non-tree edges from ancestor to descendant in DFS tree
- Cross edge : all other edges between a tree or subtrees

Theorem 22.10:

If G is undirected, a DFS produces only tree and back edges

See proof of this theorem 22.10 in textbook

Lemma 22.11:

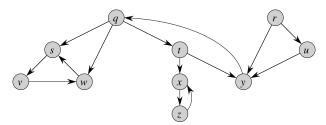

A directed graph G is acyclic iff a DFS yields no back edges

Proof:

Any back edge combines with tree edges represents a cycle in G

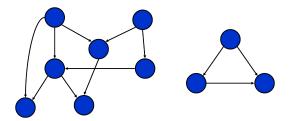

If a cycle in G, then DFS enters the cycle by a white vertex v, eventually re-visit v as a gray vertex from a vertex u in the cycle, therefore (u, v) is a back edge

We can run DFS to find whether a graph has a cycle

Directed Acyclic Graphs

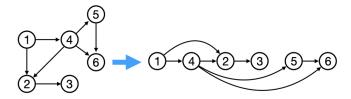

A **directed acyclic graph** or **DAG** is a directed graph with no directed cycles :

A directed graph ${\sf G}$ is acyclic iff a DFS of ${\sf G}$ yields no back edges

Topological Sort

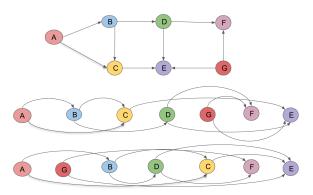

Topological sort of a DAG is a linear ordering of all vertices in graph G such that vertex u comes before vertex v if edge $(u, v) \in G$

Topological Sort

Topological sort of a DAG is a linear ordering of all vertices in graph G such that vertex u comes before vertex v if edge $(u, v) \in G$

Topological sort is not necessary unique:

Topological Sort

Topological Sort Algorithm

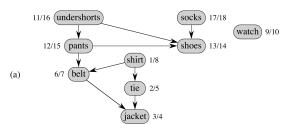

Topological-Sort()

- ► Run DFS
- When a vertex u is finished (i.e. when u.f is assigned a time value), output it

Vertices are output in reverse topological order. Time : O(V + E)

Topological Sort

Real-world example: getting dressed

Figure – 1

Consider Figure 1 above.

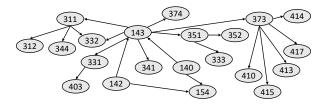

- 1. Give the adjacency list represention of this directed graph
- 2. Which node(s) have the largest in-degree value
- 3. Which node(s) have the largest out-degree value

- 4. Is the graph in Figure 1 a multi-graph? Explain briefly your answer.
- 5. How long does it take to compute the out-degree of every node?
- 6. How long does it take to compute the in-degrees?
- Give an adjacency-list representation for a complete binary tree on 8 nodes. Give an equivalent adjacency-matrix representation.
 Assume that nodes are numbered from 1 to 8 as in a binary heap
- 8. Run the breadth-first search algorithm on slide 17 on the directed graph of Figure 1, using node 1 as the source. Draw the resulting tree or, as indicated in the BFS algo give for each node i its predecessor π (parent of i in the tree) and its level d in the tree

- 9. The BFS algorithm on slide 17 assumes that the graph of Figure 1 is represented using adjacency lists.
 - 9.1 If in one instance (a) the nodes are always stored in increasing order in the adjacency lists while in another instances (b) the nodes are always stored in decreasing order, will the trees be the same in each instance?
 - 9.2 Will the depth of each node change if nodes are stored in increasing versus decreasing orders in the adjacency lists?
- 10. Using the DFS algorithm on slide 36, show how depth-first search works on the graph of Figure 1. Assume that the second **for** loop of the algorithm considers the nodes in increasing order order, and assume that nodes in each adjacency list are stored in increasing order. Write the u.d and u.f time of each node in the tree.

- 11. Using the graph of Figure 1 and the tree you obtained in the previous question, identify in Figure 1 the edges that are tree edges, back edges and forward edges
- 12. Does the graph in Figure 1 is an acyclic graph? Explain briefly your answer.
- 13. Rewrite the DFS algorithm on slide 36, using a stack to eliminate recursion

14. Show the ordering of vertices produced by TOPOLOGICAL-SORT when it is run on the dag of the Figure below
